

Data Breach Risk Assessment (DBRA)

What is DBRA?

The Data Breach Risk Assessment (DBRA) is a comprehensive and holistic review of the data security posture in your organization that will allow you to get on track with risk management of critical information assets.

Why is Risk Assessment Important?

Strong, solid organizations make key business decisions by evaluating the benefits of an opportunity to potential risks. Risk to information is no different. With the growing amount of information organizations manage in today's technology age, it is critical to be proactive.

What is the DBRA Process?

Since you know your business best, we start by working directly with you to identify the most critical information assets in your operations. During this evaluation, together we will determine the impact of a data breach on the following:

- Company Reputation
- Profitability
- Productivity
- Status with Regulators
- Employee & Customer Health & Safety

We then conduct a comprehensive review of your environment from a common sense point of view to identify specific threats and vulnerabilities and address any concerns you have about your data assets. DBRA focuses on the following key areas:

Public Web Site Review
Backup & Storage Process
IT Asset Lifecycle Management
Vendor Management
Perimeter Network Assessment
Patch Management

Physical Security
Policies & Organization Awareness
Digital Media Handling
End User Access Management
Internal Network Assessment
Content Filtering

What DBRA Can Do For You!

Reclamere DBRA™ Program will provide you with a comprehensive assessment of your information security system to allow you to establish a data security risk methodology and awareness. The executive level report of your data breach risk status and Network Assessment reports of vulnerabilities that are generated throughout the process will be invaluable tools for you to protect against the threat of a data breach.

Armor Your Assets With Reclamere's DBRA™ Program
